GDP change compared to the reference case

Melting Himalayan Glaciers

1978

1998

Mountainous glaciers were retreated drastically during 20th century

Surface Air Temperature Change (1990=0 °C)

1950

Observed Impacts of Global Warming

Retreat of Glaciers

Tianshan Glaciers (disappeared by 22% for the past 40 years)

Tibettian Glaciers (disappeared 4420km² (9%) for the past 30 years)

Himalayan Glaciers (500,000 km² to 100,000 km² by 2035)

Heat Wave

45-49°C in May, 2003 in India (1600 death)

2-3 °C increase in July, 2004 in Japan (heat stroke patients more than 600 in Tokyo)

Typhoon

10 typhoon landed in 2004 in Japan (>200 death, 120 billion \$ damage)

Increasing damage in Philippines (900 death, Nov. 2004, >500 , Dec. 2004)

Wind Storm

Increasing wind storm in Mongolia

To avoid serious CC impacts, it is likely to be necessary of temperature raise stabilization below 2 degree compared with pre-industrialized level

•It is estimated that around 50% GHG reductions in 2050 are required to control temperature raise below 2C

•Japan may be required more reduction (60-80%).
Another country-level 2050 scenarios have been studied (UK 60%, Germany 80%, France 75%, and so on).

**•Impacts will be occurred even in 2C temp control.
•Adaptation is necessary.**

1. Target may be tough

How fast we have to reduce GHG emissions?

(Source: Kawase et al. 2005)

Dominant elements for GHG emissions and national development for Japan

(Elements strongly related to GHG emissions and LCS development)

(Major elements determine Japanese development path)

2. We need “Visions”

As for LCS visions, we prepared two different but likely future societies

Vision A	Vision B
Vivid, Technology-driven	Slow, Natural-oriented
Urban/Personal	Decentralized/Community
Technology breakthrough Centralized production /recycle	Self-sufficient Produce locally, consume locally
Comfortable and Convenient	Social and Cultural Values
	 Akemi Imagawa

2. We need “Visions”

Key concepts of two scenarios

Keywords		Scenario A	Scenario B
Mindset of people			
	Goal of life	- Social success	- Social contribution
	Residence	- Urban orientation	- Rural orientation
	Family	- Self-dependent	- Cohabitation
	Acceptance of Advanced technology	- Positive	- Prudent
Population			
	Birth rate	- Downslide	- Recover
	Immigration of foreign workers	- Positively accepted	- Status quo
	Emigration	- Increase	- Status quo
Landuse and cities			
	Migration	- Centralization in large cities	- Decentralisation
	Urban area	- Concentration in city centre - Intensive land use in urban area	- Population decrease - Maintain minimum city function
	Countryside	- Significant population decrease - Advent of new businesses for efficient use of land space	- Gradual population decrease - Local town development by local communities & citizens

2. We need “Visions”

Key concepts of two scenarios (2)

Keywords		Scenario A	Scenario B
Life and household	Work	- Increase in "Professionals" - High-income & over-worked	- Work sharing - Working time reduction & equalization.
	Housework	- Housekeeping robots & Services	- Cooperation with family & neighbours
	Free time	- Paid - for activity - Improving carrier - Skill development	- With family - Hobby - Social activity (i.e Volunteer activity)
	Housing	- Multi-dwellings	- Detached houses
	Consumption	- Rapid replacement cycle of commodities	- Long lifetime cycle of commodities (Mottainai)
Economy	Growth rate	- Per capita GDP growth rate:2%	- Per capita GDP growth rate:1%
	Technological Development	- High	- Not as high as scenario A
Industry			
	Market	- Deregulation	- Adequate regulated rules apply
	Primary Industry	- Declining GDP share - Dependent on import products	- Recovery of GDP share - Revival of public interest in agriculture and forestry
	Secondary Industry	- Increasing add value - Shifting production sites to overseas	- Declining GDP share - High-mix low-volume production with local brand
	Tertiary industry	- Increase in GDP share - Improvement of productivity	- Gradual increase in GDP share - Penetration of social activity

2. We need "Visions"

Top Runner Program: Efficiency Improvement

- The “Top Runner Program” has
 - stimulated competition and innovation in the market,
 - diffused existing technologies, and
 - enhanced industrial competitiveness
- It created “win-win” situation and virtuous cycle.

Fig: Energy efficiency of refrigerator

(Source) JEMA (2002)

Projected energy efficiency improvement: Air-conditioners for cooling and heating

On these two scenarios, we allocate possible trend-breaking options

Sector	Scenario A	Scenario B
Industry	- Energy efficient production technology	- Energy efficient production technology
Residential and Commercial	- Insulation of the building - Diffusion of all-electric home - Diffusion of high efficiency heat pump air conditioner and water heater - Development and diffusion of fuel cells - Optimal energy control by HEMS	- Insulation of the building - Installing PV (especially in detached houses) - Use of biomass fuels for cooling - Diffusion of solar water heating - Education (Eco life navigation system)
Transportation	- Shortening trip distance for commuting by intensive land use - Modal shift from cars to mass transit systems (buses, railways, LRTs) - Diffusion of motor drive cars such as electric vehicles and fuel cell vehicles	- Urban structures becoming more compact - Infrastructure development for foot and bike passengers (sidewalk, bikeway, cycle parking) - Diffusion of biomass hybrid cars - Modal shift from cars to railways and to ship for freight transportation
Energy supply	- Expansion of nuclear power generation - Electric load levelling and expansion of electric storage (ex. Store the electricity generated in night time and use it for electric vehicles) - High efficient fossil fuel technologies+CCS - Hydrogen production from fossil fuel+CCS - Infrastructure development for hydrogen production, transportation, storage, application	- Expansion of renewable energy use (wind, photovoltaic, solar thermal, biomass) - Application of Information technologies (IT) for load adjustment
Stock and waste management	- Less material use for production by technology development - Advancement of recycling technologies	- Expanding lifetime of the goods - Decrease in final demand due to departure from material wealth yardsticks - Recycled product preference of the consumer

3. We need “Trend Breaks” to realize visions

To analyze the feasibility and impacts of interventions with the models

	Items to be considered	Developed Models
Industry	a. Changes in industrial structure and technological development on energy consumption as well as productivity	- Inter-sector and Macro Economic Model
Domestic and Commercial	b. Changes in building distribution by climatic zone c. Changes of the share of detached and multidwelling houses d. Diffusion rate of insulated detached and multidwelling houses e. Lifetime changes of the dwellings f. Lifestyle changes on household consumption and allocation of the time	- Building Dynamics Model (b-e) - Household Production and Lifestyle Model (f)
Transportation	g. Changes in population distribution and local characteristics h. Changes in social environment and human activities i. Changes in selectivity of the mode of passenger transportation by area j. Changes in industrial structure k. Dematerialization l. Changes in producing/consuming area m. Changes in selectivity of the mode of transportation by distance	- Passenger Transportation Demand Model (g-i) - Freight Transportation Demand Model (j-m)
Energy supply	n. Function of load management and uncertainties of both energy supply and demand o. Combination of small consumer and small energy sources + Electricity/Hydrogen p. Feasibility of local production for local consumption	- Energy Supply and Demand Balance Model (n-p)
Social system	q. Relationship between economic activities and stock/flow of the materials r. Amount of waste derived from the stock s. Effectiveness of recycling and its impacts	- Material Stock and Flow Model (q-s)
Cross-sectional	t. Ensuring consistency among the sectors in terms of energy demand and supply u. Impacts of future technological choices on social energy efficiency v. Ensuring economical consistency of LCS	- Menoco Model (t) - EDB (u) - Inter-sector and Macro Economic Model (v)

Outputs Database Inputs Database

• Option	Gasoline hybrid vehicle		
• Code	TR_HYBRID		
• Environmental Issue	[CC]: Climate Change		
• Sector	[TR]: Transportation sector		
• Description	A car with two different power units (motor and engine). Drive using the motor allows improved mileage, low noise, low exhaust emissions and so on. Since there is no need to provide special energy supply infrastructure like that required by electric cars for recharging, this represents a basic car technology that will lead to future fuel cell cars.		
• Technical Barrier	Since multiple power sources are used, the biggest issues are achieving a small, lightweight system, and reducing prices.		
• Social Barrier			
• Secondary Effect	Generally contribute to reducing emissions of atmospheric pollutants such as NOx. Also reduce noise.		
• Basic Unit	Name	Value	Unit
	Unit		1 Unit

Global Challenges Toward
Low-Carbon Economy (LCE), Dec.3, 2005

Japan–UK Joint Research Project

Developing visions for a Low Carbon Society (LCS)

through sustainable development

**Organized by MoEJ, Defra, NIES, UKERC,
Tyndall Centre for Climate Change Research**

Japan and UK promote studies toward achieving a **Low Carbon Society (LCS) by 2050** in collaboration, encourage other countries to engage in LCS studies, and jointly hold series of international workshops. The first workshop was held in June 2006 in Tokyo **involving researchers and governmental officials from about 20 countries**, and international organizations.

1st workshop on Japan – UK Joint Research Project Developing visions for a Low Carbon Society (LCS) through sustainable development on June 2006

Participants from 19 countries;

Asia: Japan, China, India, Thailand, Taiwan (China)

Africa: South Africa, Nigeria

Europe: UK, France, Germany, Denmark, Spain, Netherlands, Russia

Latin America: Brazil, Mexico, Chile

North America: US, Canada

A second workshop will be held in UK, 2007.

“Aligning sustainable development & climate change actions can reduce the burden and facilitate the transition to stabilization. LCS is technologically and economically feasible.”

Economy-environment trade-off can be circumvented with innovative strategies and by exploiting co-benefits

We appreciate your participation!

- 1) Aligning climate change and sustainable development actions will facilitate cost-effective transition to stabilization of climate change.**
- 2) A variety of tools (e.g. models) & methods (e.g. backcasting, scenarios) are required to delineate options for cost-effective transition to low carbon pathways**
- 3) Cooperation for LCS involves a long-term policy framework, a wider range of issues and actors (domestic & international) and a comprehensive range of technologies and policy measures. Political vision and leadership are vital to generate signals, prompt activities and deploy resources to achieve LCS goals.**

AIM always supports your modeling activity!

**AIM is model, AIM is team,
AIM is human network**
